

How Finné uses AI, in plain words

A short explanation of where AI sits in our product, what it is allowed to do, and what it can never do. No technical background needed.

Version 1.0 · 3 August 2026 · Written for the whole team and anyone we share the product with

What Finné does

Businesses pay people in digital dollars. Sometimes a payment goes wrong: work is challenged, money is pulled back, and nobody has a record of why. Finné gives every payment a file: what the payment was for, what the rules were, what each side says, and, if there is a disagreement, who decided it and why. A person reads the file and makes the call. The money then moves through the payment system both sides already use.

The simplest way to picture the AI

Think of the AI as a junior clerk in a law office. The clerk gathers the papers, puts them in order, and writes a list of the questions the case turns on. The clerk never signs anything, never gives a verdict, and never touches the client's money. A person does all three.

That is the whole design. Everything below is detail.

What the AI is allowed to do

It prepares. When a disagreement is opened, most of the file is built by ordinary software following fixed rules: was the amount right, was the work delivered on time, was the complaint raised within the deadline in the terms. These checks give the same answer every time and anyone can re-run them. The AI sits beside them and helps with the untidy parts, such as putting a long message thread into a short summary.

It points. On the decision screen, the AI lists the questions the reviewer needs to answer. For example: was the third video delivered inside the 48-hour grace period in clause 4? It shows the dates and the clause. It asks the question. It does not answer it.

It shows its sources. Every line the AI writes points back to the paper it came from: the message, the contract, the payment record. If a line has no source, it is not shown at all. A reviewer never has to take the AI's word for anything.

What the AI can never do

It cannot move money. The AI has no access to any wallet or key. Money moves only when the reviewer, a person, approves a decision and signs it themselves. This is not a policy we promise to follow. It is built into the software, and it is tested.

It cannot decide. There is no button anywhere in Finné that lets the AI settle a case. The record where the AI writes has no space for a verdict, on purpose, so a verdict cannot slip in.

It cannot take sides. The AI prepares the file the same way whichever side looks stronger. Same layout, same depth, for both. We test for this the way we test everything else, and an AI that leans is treated as a fault to fix, not a feature.

It cannot send our data anywhere. The AI runs on our own computers. Nothing from a case, no contract, no message, no name, is sent to an outside AI company. If someone asks where the data goes, the answer is: nowhere.

What happens if the AI breaks

Finné works without it. If the AI is slow, wrong, or switched off, the file still builds from the fixed-rule checks, the reviewer still reads the evidence, and the decision still gets made. We prove this by running the whole product with the AI unplugged, as a routine test. The AI saves time. It is never the thing the case depends on.

Why we built it this way

Our product is trust. A platform lets us near its payments because every step can be checked: the facts carry their sources, the rules are written down, a person decides, and the record cannot be quietly changed afterwards. An AI that decided things on its own would break that promise on day one. An AI that prepares, points, and shows its work makes the person faster without asking anyone to trust a machine.

The one-line version. The AI is our clerk. It prepares the file, points at the questions, and shows its sources. A person decides. Software both sides can check moves the money. Nothing leaves our machines.

Questions people ask

Is the AI judging people's disputes? No. A person at the platform judges. The AI helps them read the file faster.

Could the AI make a mistake? Yes, and the design expects it. Anything the AI writes is checked against its source, and anything important is read by a person before it matters. A mistake gets caught; it does not get acted on.

Whose AI is it? We run openly published AI models on our own machines. We do not send data to any AI company, and no AI company trains on our cases.

Will the AI do more later? Yes, gradually: sorting new complaints, reading documents, spotting odd patterns. Each addition follows the same rules as the clerk: prepare and point, never decide, never touch money, always show sources.
